First, all the input images must be preprocessed. Then, the dimensionality of that image must be reduced. And, at last it must be classified using neural network training algorithm. Following neural networks are used for training purposes with preprocessed image – Fully-connected multilayer feed-forward neural network trained with the help of back-propagation algorithm. For dimensionality reduction, Principal Component Analysis (PCA) is used.

Neural Network Definition - Investopedia

The Transformer is a deep learning model introduced in 2017, used primarily in the field of natural language processing (NLP).. Like recurrent neural networks (RNNs), Transformers are designed to handle sequential data, such as natural language, for tasks such as translation and text summarization.However, unlike RNNs, Transformers do not require that the sequential data be processed in order.

Transformer (machine learning model) - Wikipedia

Artificial neural networks (ANNs), usually simply called neural networks (NNs), are computing systems vaguely inspired by the biological neural networks that constitute animal brains. An ANN is based on a collection of connected units or nodes called artificial neurons, which loosely model the neurons in a biological brain.
