ECG values are measured by placing non-invasive electrodes at the surface of the patient's skin. For a 3-lead ECG sensor, the electrodes need to be placed in a triangle (Einthoven Triangle) on the patient's chest as shown in the figure 11. Each corner of the triangle corresponds to one of the limbs: right hand, left hand, left foot.

The basic principle behind these pressure transducers is that pressure to be measured is applied to a flexible diaphragm which gets deformed by the action of the pressure exerted on it. This motion of the diaphragm is then measured in terms of an electrical signal. The deformation is measured by a strain gauge or LVDT.
