When the system reaches equilibrium, the solution compartment is elevated 5.6 cm above the solvent compartment.

Colligative Properties of Solutions: Problems and ... As noted previously in this module, the colligative properties of a solution depend only on the number, not on the kind, of solute species dissolved. For example, 1 mole of any nonelectrolyte dissolved in 1 kilogram of solvent produces the same lowering of the freezing

point as does 1 mole of any other nonelectrolyte.

## 11.4: Colligative Properties - Chemistry LibreTexts

This third category, known as colligative properties, can only be applied to solutions. By definition, one of the properties of a solution is a colligative property if it depends only on the ratio of the number of particles of solute and solvent in the solution, not the identity of the solute.

## Colligative Properties - Purdue University

As we have discussed, solutions have different properties than either the solutes or the solvent used to make the solution. Those properties can be divided into two main groups--colligative and non-colligative properties. Colligative properties depend only on the number of dissolved particles in solution and not on their identity. Non-colligative properties depend on the identity of the dissolved species and the solvent.

## Colligative Properties of Solutions: Colligative ...

In chemistry, colligative properties are those properties of solutions that depend on the ratio of the number of solute particles to the number of solvent molecules in a solution, and not on the nature of the chemical species present. The number ratio can be related to the various units for concentration of a solution, for example, molarity, molality, normality (chemistry), etc.

properties include vapor pressure lowering, boiling point elevation, freezing point depression, and osmotic pressure. This small set of properties is of central importance to many natural phenomena and technological applications, as will be described in this module.

Solutions colligative properties - Chemistry test. 1)

Molarity of a solution is expressed as: a) the number of moles of a solute present in one litre of the solution. b) the number of moles of a solute present in 1000 gm of the solvent. c) the number of gram equivalent of solute present in one litre of solution.

Osmotic pressure is a colligative property that can be used to determine the molar mass of an unknown substance. The osmotic pressure is determined by measuring the height of the column of solution and converting this value to mm of Hg (1 mm Hg = 1 torr, 760 torr = 1 atm).

## CHEMISTRY 142 – Example Problems

Know that colligative properties are properties that depend on the concentration of particles in solution but not on the nature of the particles. List three colligative properties, and explain how the presence of the solute impacts the physical property of the solvent.

## Colligative Properties Exercises

Because they are "tied together" (Latin, *co ligare*) in this way, they are referred to as the colligative properties of solutions. The colligative properties that we will consider in this and the next unit apply to solutions in which the solute is non-volatile; that is, it does not make a significant contribution to the overall vapor pressure of the solution.

Properties of pure liquids change when a solution is formed. Some of these properties are referred to as follows: Vapor Pressure Lowering; Freezing Point Depression; Boiling Point Elevation; Osmotic Pressure; The greater the concentration of the solute(s) in the solution, the larger the change in these properties.
