and the external magnetic field  $H$  is fixed. In case of magnetic system one aim to determine thus  $Z(T,V,H)$ , and consequently using (3) the  $F(T,V,H)$  free energy. The magnetization of the system is determined as  $M = \frac{1}{\mu_0} \left( \frac{\partial F}{\partial H} \right)$  (4) The most important experimentally measurable material dependent quantities that characterize the magnetic, materials is the susceptibility ( $\chi$ ). Susceptibility can be determined now as:

**BASIC THEORY OF MAGNETS** Animesh K. Jain RHIC Project, Brookhaven National Laboratory, Upton, New York 11973-5000, USA Abstract The description of two dimensional magnetic fields of magnets used in accelerators is discussed in terms of a harmonic expansion. The expansion is derived for cylindrical components and extended to

## **BASIC THEORY OF MAGNETS**

Spin angular momentum is twice as effective as orbital angular momentum in creating a magnetic moment. Generally there is both spin and orbital angular momentum for an atomic electron. They produce a total angular momentum  $j$ ,  $j = l + s$ ;  $m = -g j (e/2m)j$

In effective-field theories of magnetism, the energy levels of a small cluster of spins are determined exactly and the cluster is then assumed to exist in an effective magnetic field due to surrounding spins. As the cluster size is increased, the accuracy of the results improves slowly, but the computational difficulties expand rapidly.

Magnetic Field Generated by Current: (a) Compasses placed near a long straight current-carrying wire indicate that field lines form circular loops centered on the wire. (b) Right hand rule 2 states that, if the right hand thumb points in the direction of the current, the fingers curl in the direction of the field.

In a magnetic field, the magnetic moments align and are magnetized in the direction of the applied field, reinforcing it. Examples of paramagnetic materials include magnesium, molybdenum, lithium, and tantalum. Ferromagnetism: Ferromagnetic materials can form permanent magnets and are attracted to magnets. A ferromagnet has unpaired electrons, plus the magnetic moments of the electrons tend to remain aligned even when removed from a magnetic field.

## What Is Magnetism? Definition, Examples, Facts

The magnetic field spreads out when it encounters the small air gap created by the crack because the air cannot support as much magnetic field per unit volume as the magnet can. When the field spreads out, it appears to leak out of the material and, thus is called a flux leakage field. If iron particles are sprinkled on a cracked

magnet, the particles will be attracted to and cluster not only at the poles at the ends of the magnet, but also at the poles at the edges of the crack.
