When developing more complex models it is often desirable to report a p-value for the model as a whole as well as an R-square for the model.. p-values for models. The p-value for a model determines the significance of the model compared with a null model. For a linear model, the null model is defined as the dependent variable being equal to its mean.

The R 2 value is a measure of how close our data are to the linear regression model. R 2 values are always between 0 and 1; numbers closer to 1 represent well-fitting models. R 2 always increases as more variables are included in the model, and so adjusted R 2 is included to account for the number of independent variables used to make the model ...
