It discusses the fast integral wavelet transform (FIWT). Other wavelets and algorithms such as ridgelets, curvelets, complex wavelets, and lifting algorithm are briefly described. Computation of the integral ridgelet transform is very cumbersome and inefficient. The first \u0026amp; generation curvelet is based on the extension of ridgelet transform in the blocks of subband images of the original image.

Multiresolution analysis (MRA) forms the most important building block for the construction of scaling functions and wavelets and the development of algorithms. This chapter begins with an understanding of the requirements of MRA. It explains two \u0026amp; scale relations and decomposition relations. Cardinal B \u0026amp; splines, generate an MRA and form the basis of most of the wavelets that are discussed in the chapter.
