An industrial communication network is a backbone for any automation system architecture as it has been providing a powerful means of data exchange, data controllability, and flexibility to connect various devices. With the use of proprietary digital communication networks in industries over the past decade led to improve end-to-end digital signal accuracy and integrity.

IEC 60870-5-101 defines all the necessary application level functions and data objects to provide for telecontrol applications operating over geographically wide areas, using low bandwidth bit-serial communications. It covers general communications with RTUs, including data types and services that are suitable for electrical and substation systems.

Digital data communications through protocols has the
advantages that it is inherently more stable, reliable, and less
susceptible to electrical noise than analog signals. Another
advantage of digital communications is that a lot of data can
be communicated on a single network or fieldbus cable.
