Animal Bone Identification - Peterborough Archaeology

They are often the largest teeth in a mammal's mouth. Individuals of most species that develop them normally have four, two in the upper jaw and two in the lower, separated within each jaw by incisors; humans and dogs are examples. In most species, canines are the anterior-most teeth in the maxillary bone.

Canine tooth - Wikipedia

Animal Bones and Teeth Zooarchaeologists seek to answer questions about the human past using animal remains from the archaeological record. These researchers explore what people ate, what environments were like, the movements of animals across landscapes, relationships between people and animals, and more.
