The Net Ionic Equation Lab dealt with many concepts involving ions as well as reactions. There are three types of reactions that can take place. One is a precipitation reaction that takes place when two soluble substances are mixed and form a precipitate or insoluble solid. Another is a neutralization reaction where two things react and form water.

Net ionic equations tell us only what is actually changing during reaction. Net Ionic Equation: $Cl^{-}(aq) + Ag^{+}(aq) \rightarrow AgCl(s)$ Another example is illustrated below for the reaction of nitric acid and a dilute aqueous solution of barium hydroxide (an acid-base reaction): Molecular Equation: $2HNO_3(aq) + Ba(OH)_2(aq) \rightarrow 2H_2O(l) + Ba(NO_3)_2(aq)$ Total Ionic Equation: $2H^{+}(aq) + 2NO_3^{-}(aq) + Ba^{2+}(aq) + 2OH^{-}(aq) \rightarrow 2H_2O(l) + Ba^{2+}(aq) + 2NO_3^{-}(aq)$

The gases that were observed during the lab do not react when trying to write a chemical equation, but two of the solutions we tested, hydrochloric acid and sodium carbonate, react to produce carbon dioxide gas, even though this was not observed ($2HCl(aq) + Na_2CO_3 \rightarrow 2NaCl(aq) + H_2CO_3(aq)$, $H_2CO_3 \rightarrow H_2O(l) + CO_2(g)$). 4) Water is a polar molecule, and this causes it to be called the universal solvent.

From the balanced chemical reaction, the net ionic equation can be derived. The net ionic equation only includes the ions that participated in the reaction. It is formed by breaking down the strong acids and bases into ions, and removing the spectator ions, or the ions that did not change from the reactant side to that of the products. The remaining ions comprise what is called the net ionic equation.
