Squid Dissection Lab Answers

Squid have 8 arms covered with suction cups. The tentacles are longer than the arms and have suction cups only at the tips. These are used to pass food to the shorter arms and then to the mouth. The suction cups help the squid to hold onto food. The squid is related to other "shelled" animals like clams and snails.

Exploring Anatomy: Squid Dissection | Shedd Aquarium

Squid Dissection. The Squid Dissection program at Hatfield Marine Science Center is designed to be a 50- minute lab-based program for 4th-12thgrade students, which examines the external and internal morphology of the California market squid. Students will learn about classification of mollusks then work in pairs, following the directions of their marine educator, to systematically dissect a thawed squid and explore the many adaptations they have for survival in the marine environment.

Examine the exterior of the squid and note the 2 fins located at the dorsal end. These fins assist in locomotion and are used primarily to help the squid orient and steer itself through the water. In some squid, the fins also help to propel the animal. You may have to pull the fins away from the body to better observe them.
