Let's look at a standard 3-axis vertical machining center as an example. When designing a part for 3-axis machining, one must consider the function of the machine: the cutting tool moves along three axes but always faces downwards, which naturally limits the kind of cuts the machine can make in the workpiece. If you create a diagonal cavity on the underside of the part, the machine will not be able to cut it unless the part is completely reoriented.

CNC machining is the process of removing material from a workpiece until the desired shape is configured. These machines have at least a 3 axes and operate along an XYZ plane: X axis (vertical), Y axis (horizontal), and a Z axis (depth). The 4 th axis denotes the inclusion of an A axis (rotation around the X axis), and the 5 th axis denotes the B axis (rotation around the Y axis).

If you think in terms of a 3-axis machining center, it has an X-axis, Y-axis, and Z-axis. With a 5-axis machining center, the additional rotary axes will rotate about two of those three primary axes. The axis that rotates about the X-axis is called the A-axis. The axis that rotates about the Y-axis is called the B-axis.
